PROBLEM STATEMENT

Smart Lost & Found Management System

Objective : To create a platform to report lost and found item and intelligently match them based on available data.

OUR APPROACH

- **Digital Unification :** Create a single, accessible platform dedicated exclusively to managing campus lost-and-found.
- **Context Aware :** Utilize geolocation so users can pinpoint exactly where an item was lost or found.
- **Algorithmic Assistance**: Move away from manual searching by building intelligent matching algorithms that suggest potential item correlations.
- **Privacy-First:** Build an off-public messaging and claim verification system to protect student data.

THE SOLUTION

Introducing FindInCampus

- **Interactive Map & HeatMaps :**
  * Users can drop exact location pins for items.
  * Heatmaps allow campus security or students to identify high-risk "loss hotspots".

- **Intelligent Item Matching :**
  * Built-in semantic heuristics compare items.
  * It automatically recommends correlations between newly reported constraints and existing database entries.

Secure Workflows & Resolution

- **Secure Resolution Workflow :**
  * A robust “Claim” system requiring owners to submit detailed proof of ownership.
  * Status tracks from “Reported” to “Resolved”.

- **Integrated Secure Chat :**
  * Peer-to-peer messaging system.
  * Offloads public listing exposure; finders and owners communicate privately.

THANK YOU
